

QuickID Allows Law Enforcement to Locate and Search Records Faster and More Precisely

IMAGEWARE[®]

QuickID

QuickID: Where Thorough Identification Matters

ImageWare System's QuickID allows Law Enforcement users to locate records based on a set of biographic or biometric criteria to identify or verify the identity of a subject. QuickID can be integrated with QuickCapture and QuickBadge, as well as other third-party software, to create a complete credentialing software package.

QuickID allows users to conduct custom searches based on biometric images or biographical information. Multiple biometrics or biographics may be used within a given search which will produce a *fused* confidence score. For a given search, the system will return all records that are within the acceptable threshold established in QuickConfig. The higher the threshold, the lower the number of records that will be returned.

Types of Search

1:1 - Verification

This mode attempts to verify that the sample provided matches the indicated person.

1:N - Identification

Identification attempts to match the provided sample with an individual out of the whole population.

X:N - Investigative

Investigative searches can be run against watch lists and black lists.

QuickID is **hardware agnostic** and **integrates with existing biometric collection devices** such as iris scanners, fingerprint machines, and facial image cameras

Biometrics supported by QuickID

Face

Finger

Iris

Palm

Voice

Flexibilities with QuickID

- **Set paths** to the various connections that will be used **for searching**
- **Choose the biographic information fields** that are available for the biographic portion of the search
- **Select devices** that will be used **for the various biometrics** which will be used as search probes
- **Set thresholds** for multiple **search elements**
- **Design the search results list** and preview panels which users will see at the end of a search
- **Conduct custom searches** from an image or biographical information
- **Searches and their components**, such as search time, number of records, type of search, and modalities used, **are saved in a queue for easy recall (results and search criteria are erased when the app is exited)**
